volunteerVerification

Methods

volunteerVerification(req, res)

Middleware for verifying the volunteer's JWT token. This function checks for the presence of a token in cookies and verifies it. If verification is successful and the user is found in the database, it responds with the user's username. Otherwise, it returns a status indicating the failure of the token verification.

Parameters:

Name	Type	Description
req	Object	The request object from Express, containing cookies with JWT token.
res	Object	The response object from Express, used to return the verification status and user information.
